# What is Linked Data?

**Linked Data** is structured data published and interlinked using standard Web technologies to make the connections readable by computers, enabling data from different sources to be connected and queried.

**Linked Open Data (LOD)** must be publicly available under an open license.

*Image source: [Wikipedia](#)*

# How It Started

**1989** — Tim Berners-Lee invents the World Wide Web

**1993** — the World Wide Web released into the public domain, for general use, at no cost

**1994** — the World Wide Web Consortium (W3C) is founded

**1999** — Berners-Lee publishes his vision of the Semantic Web

**2006** — the term Linked Data is coined in a design note about the Semantic Web project

# How It's Going

## Linked Open Data cloud <https://lod-cloud.net/>

As of March 26th, 2025, the LOD cloud contains **1,354 datasets** (nodes)

Provides downloadable metadata for all listed datasets + original download links and endpoints

# Datasets

OLLSCOIL NA GAILLIMHE  
UNIVERSITY OF GALWAY

- [DBpedia](#) — community effort to extract structured data from Wikipedia; contains 9.5 billion structured pieces of information (triples)
- [WikiData](#) — free knowledge database project hosted by Wikimedia and edited by volunteers; 12.5 billion triples
- [GeoNames](#) — user-editable geographical database, 93,896,732 triples
- [Europeana](#) — metadata on 2.4 million texts, images, videos and sounds, 117 million triples
- Government datasets
  - [data.europa.eu](#)
  - [data.gov.uk](#)
  - [data.gov.ie](#)
  - [data.gov](#)

**DBpedia**

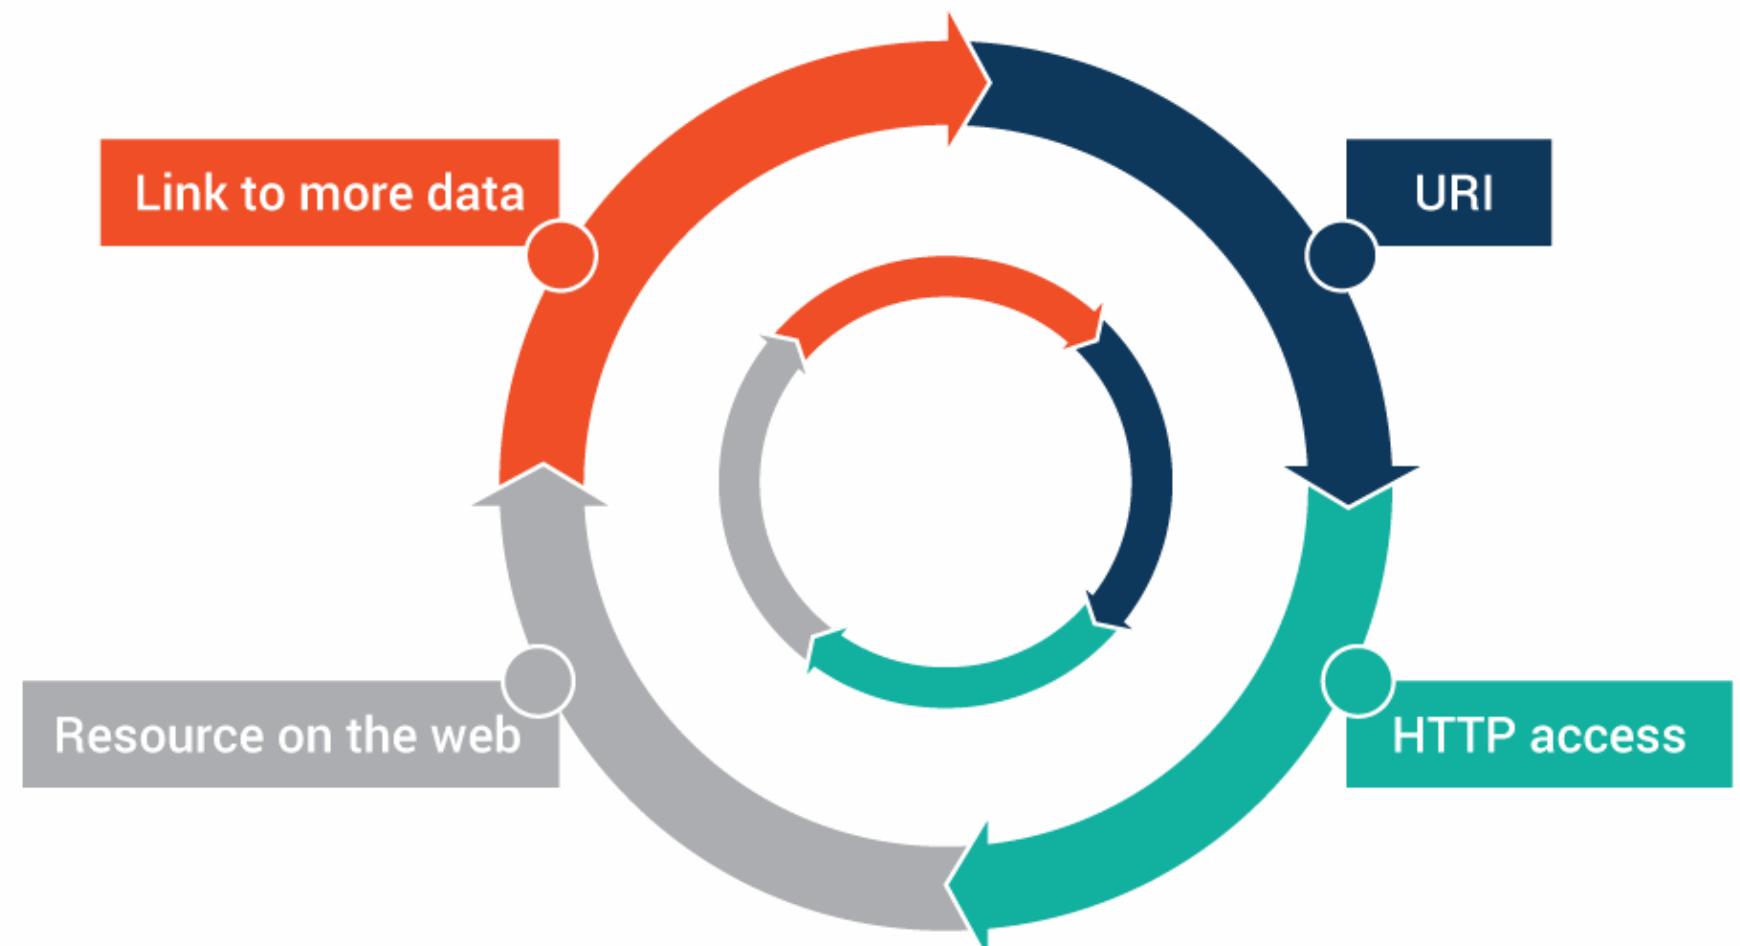

# LOD Design Principles

OLSCOIL NA GAILLIMHE  
UNIVERSITY OF GALWAY

1. **Uniform Resource Identifiers (URIs)**  
should be used as names for things
2. HTTP URIs should be used so that people can look up those names.
3. When someone looks up a URI, useful information should be provided through open standards such as **RDF**, **SPARQL**, etc.
4. Other things should be referred to with their URI-based names.

<https://www.w3.org/DesignIssues/LinkedData.html>

Image source: [Ontotext](#)

# Uniform Resource Identifier (URI)

**Uniform Resource Identifier (URI)** — a compact sequence of characters that identifies an abstract or physical resource ([RFC 3986 Uniform Resource Identifier \(URI\): Generic Syntax](#))

**Uniform Resource Locator (URL)** — a type of URI that refers to a resource on the web

**Internationalised resource identifier (IRI)** — a URI that allows Unicode characters

- `ftp://ftp.is.co.za/rfc/rfc1808.txt`
- `http://www.ietf.org/rfc/rfc2396.txt`
- `http://publications.europa.eu/resource/authority/country/BEL`
- `mailto:John.Doe@example.com`
- `tel:+1-816-555-1212`
- `telnet://192.0.2.16:80`
- `file://localhost/etc/config`

# HTTP URIs

OLSCOIL NA GAILIMHE  
UNIVERSITY OF GALWAY

http://example.com:8080/animals/domestic?name=cat#paw

**scheme:** specifies type of URI (and the associated protocol)

**authority:** hostname and optional port number

**path:** reference to content on the host server; can be interpreted in a hierarchical fashion (like a directory tree on a file system)

**query:** contains data that doesn't match tree structure (variables)

**fragment:** addresses local part of a document

**IANAs registered schemes:**  
<http://www.iana.org/assignments/uri-schemes/uri-schemes.xhtml>

# RDF & OWL

**Resource Description Framework (RDF)** is a standard used to describe and exchange linked data.

In RDF, pieces of information are represented as **triples** that consist of a subject, an object and a predicate. A predicate is a directed link from subject to object.

**RDF Schema (RDFS)** and **Web Ontology Language (OWL)** are ontology languages used to describe RDF data.

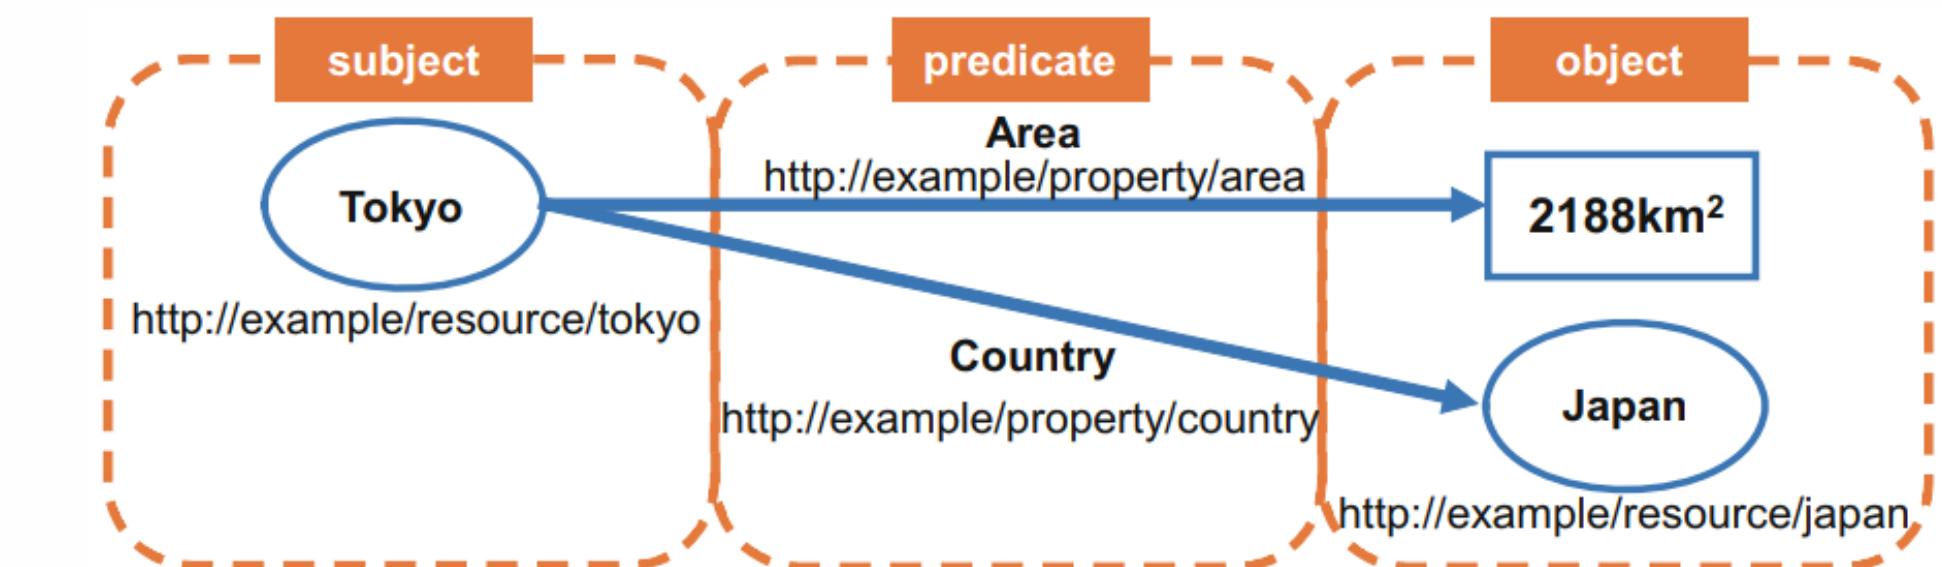

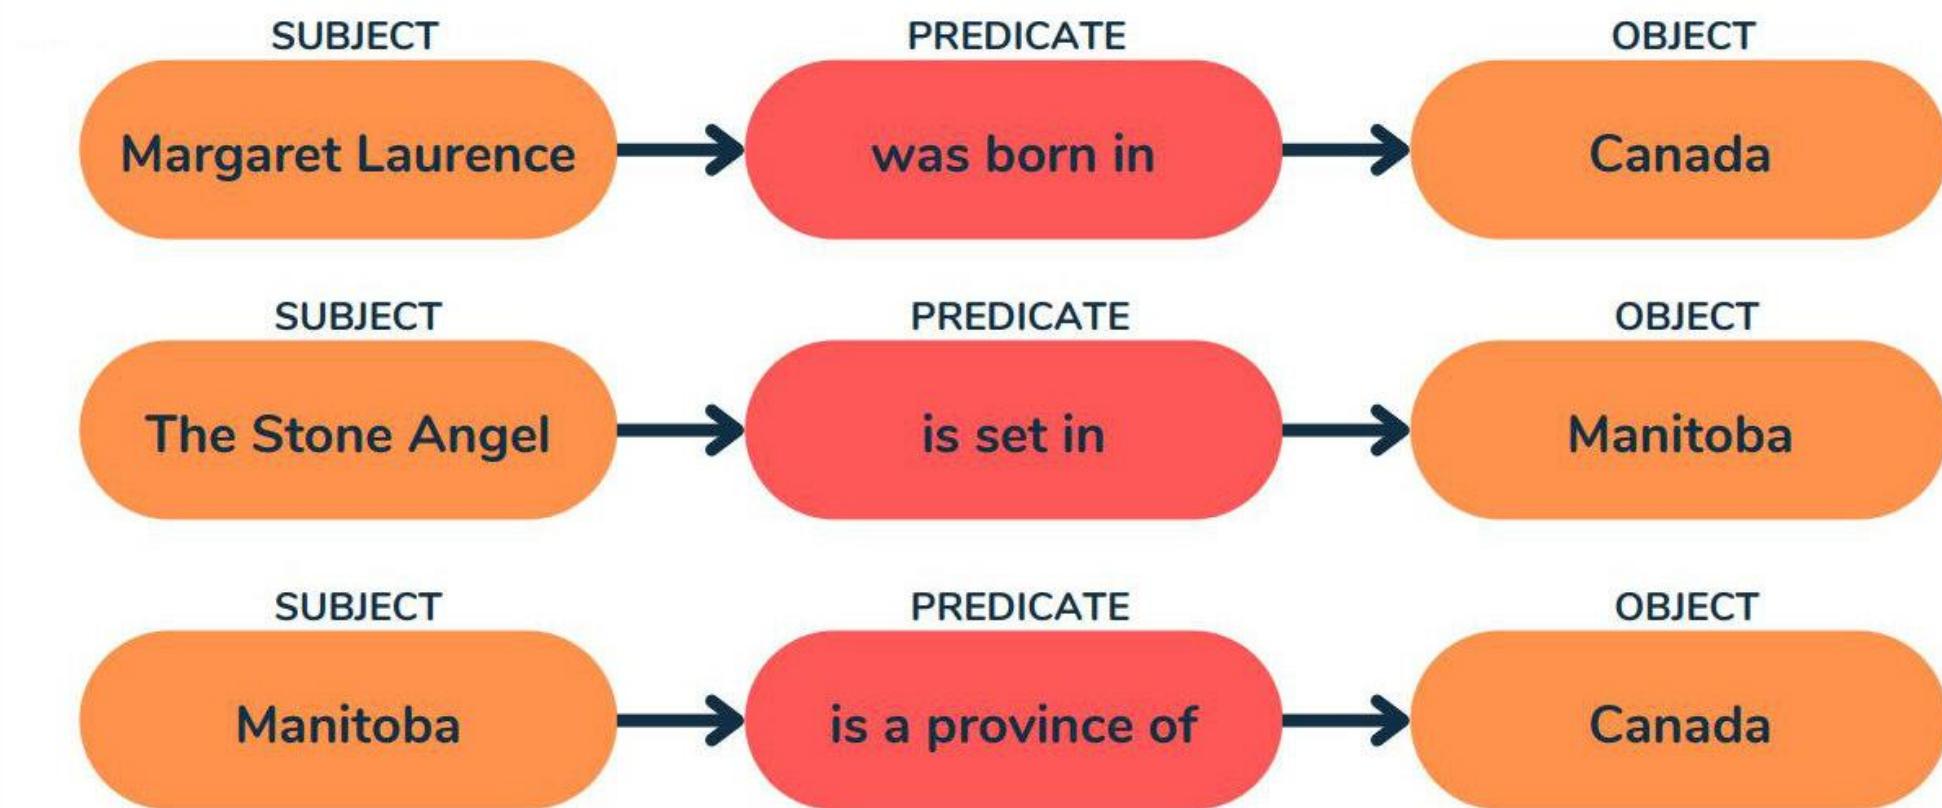

An **ontology** is a formal linked data model that describes the types of things that exist (classes), the relationships between them (properties) and the logical ways those classes and properties can be used together (axioms).

A collection of triples is a **knowledge graph (KG)**.

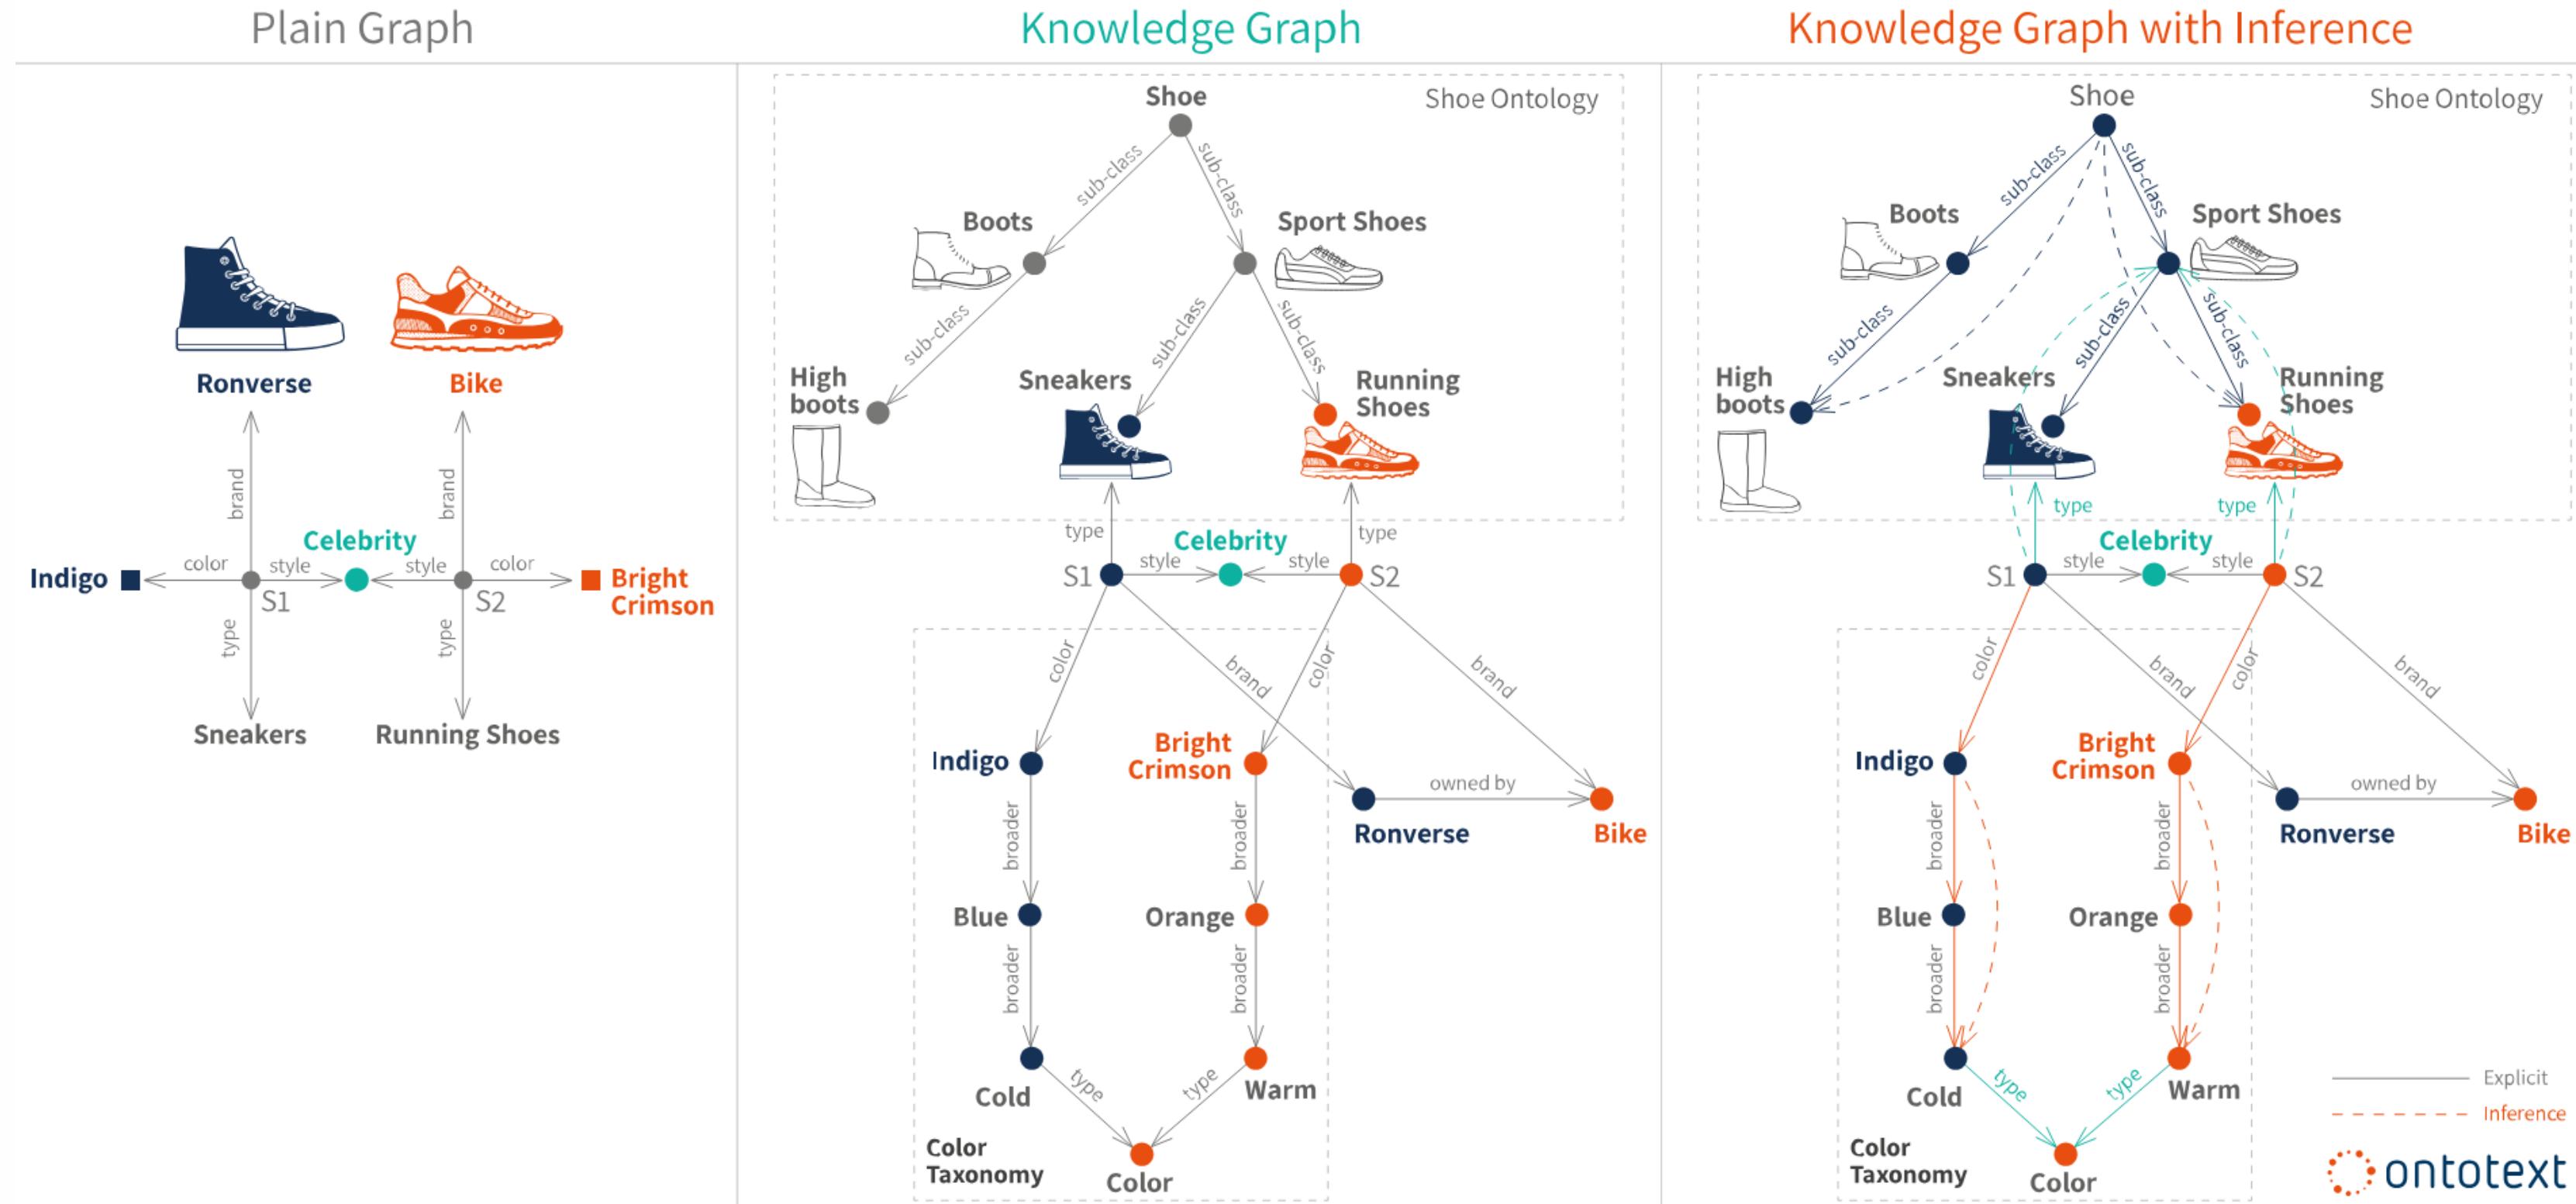

**Linked Data Glossary:**  
[https://www.w3.org/TR/  
ld-glossary/](https://www.w3.org/TR/ld-glossary/)

# RDF triples

# Knowledge Graphs

# Linking Resources

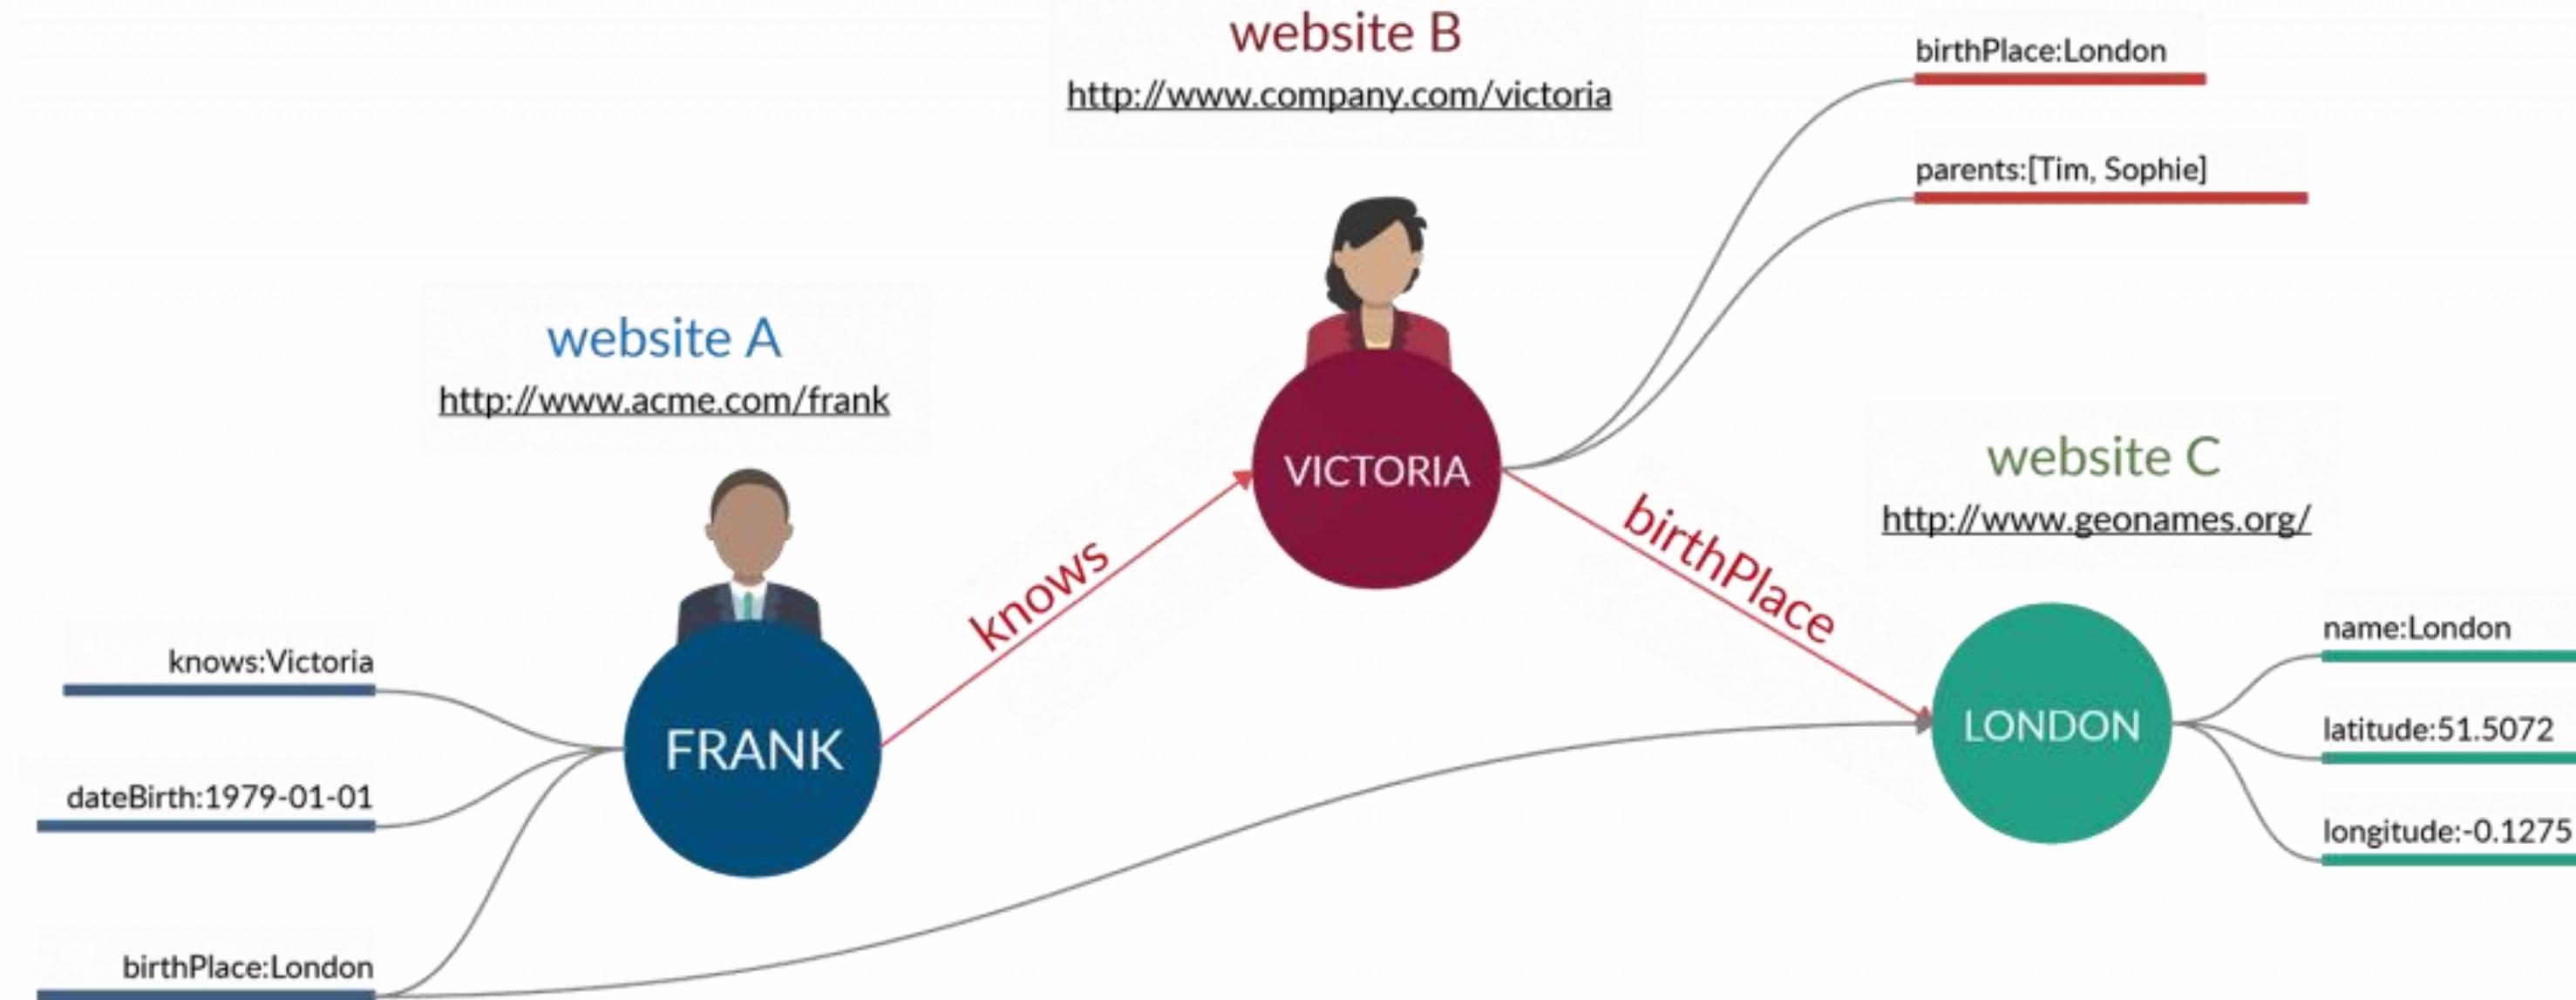

Image source: [Fontistoriche](#)

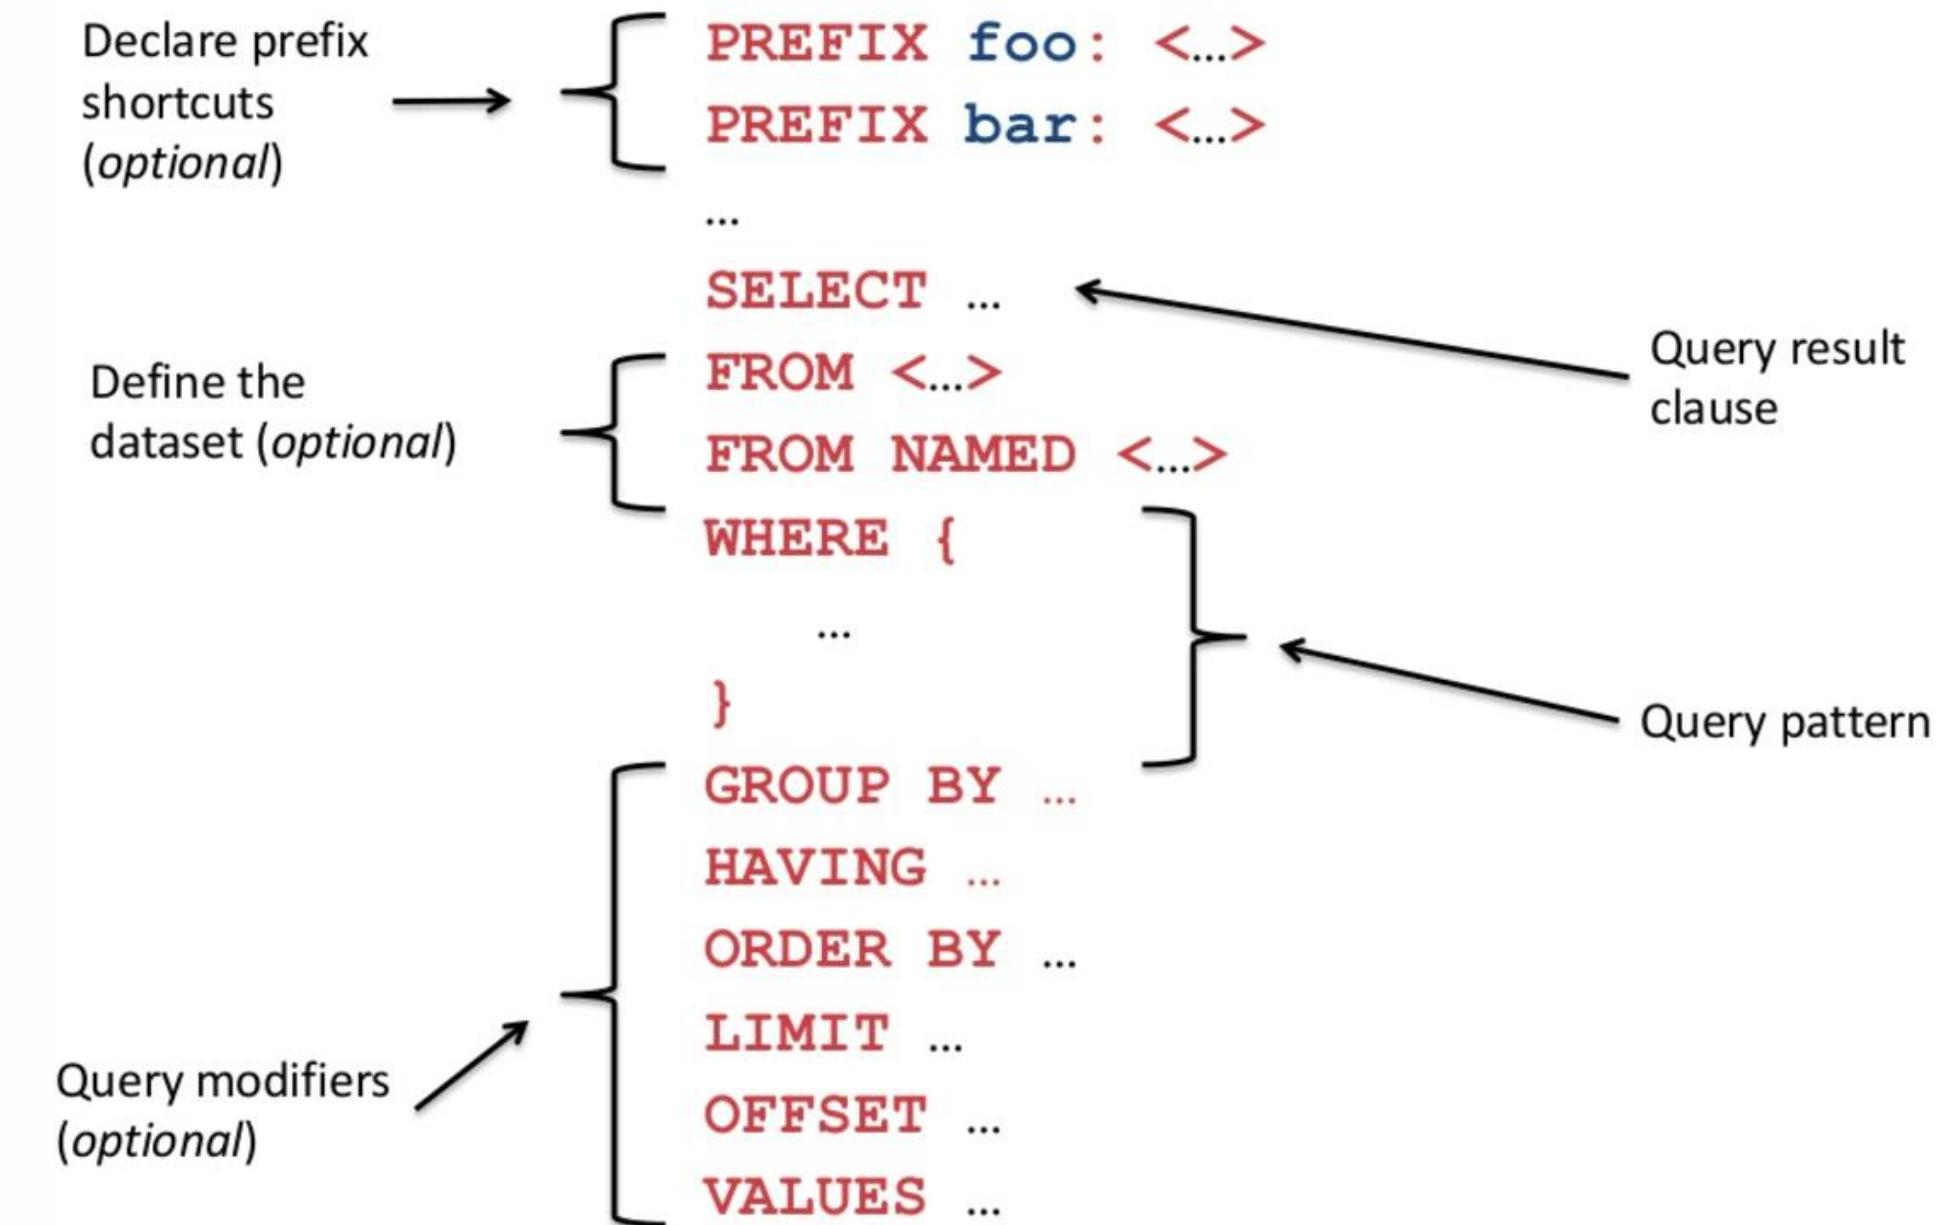

# SPARQL

**SPARQL Protocol and RDF Query Language**, or just **SPARQL** is a query language for RDF graphs.

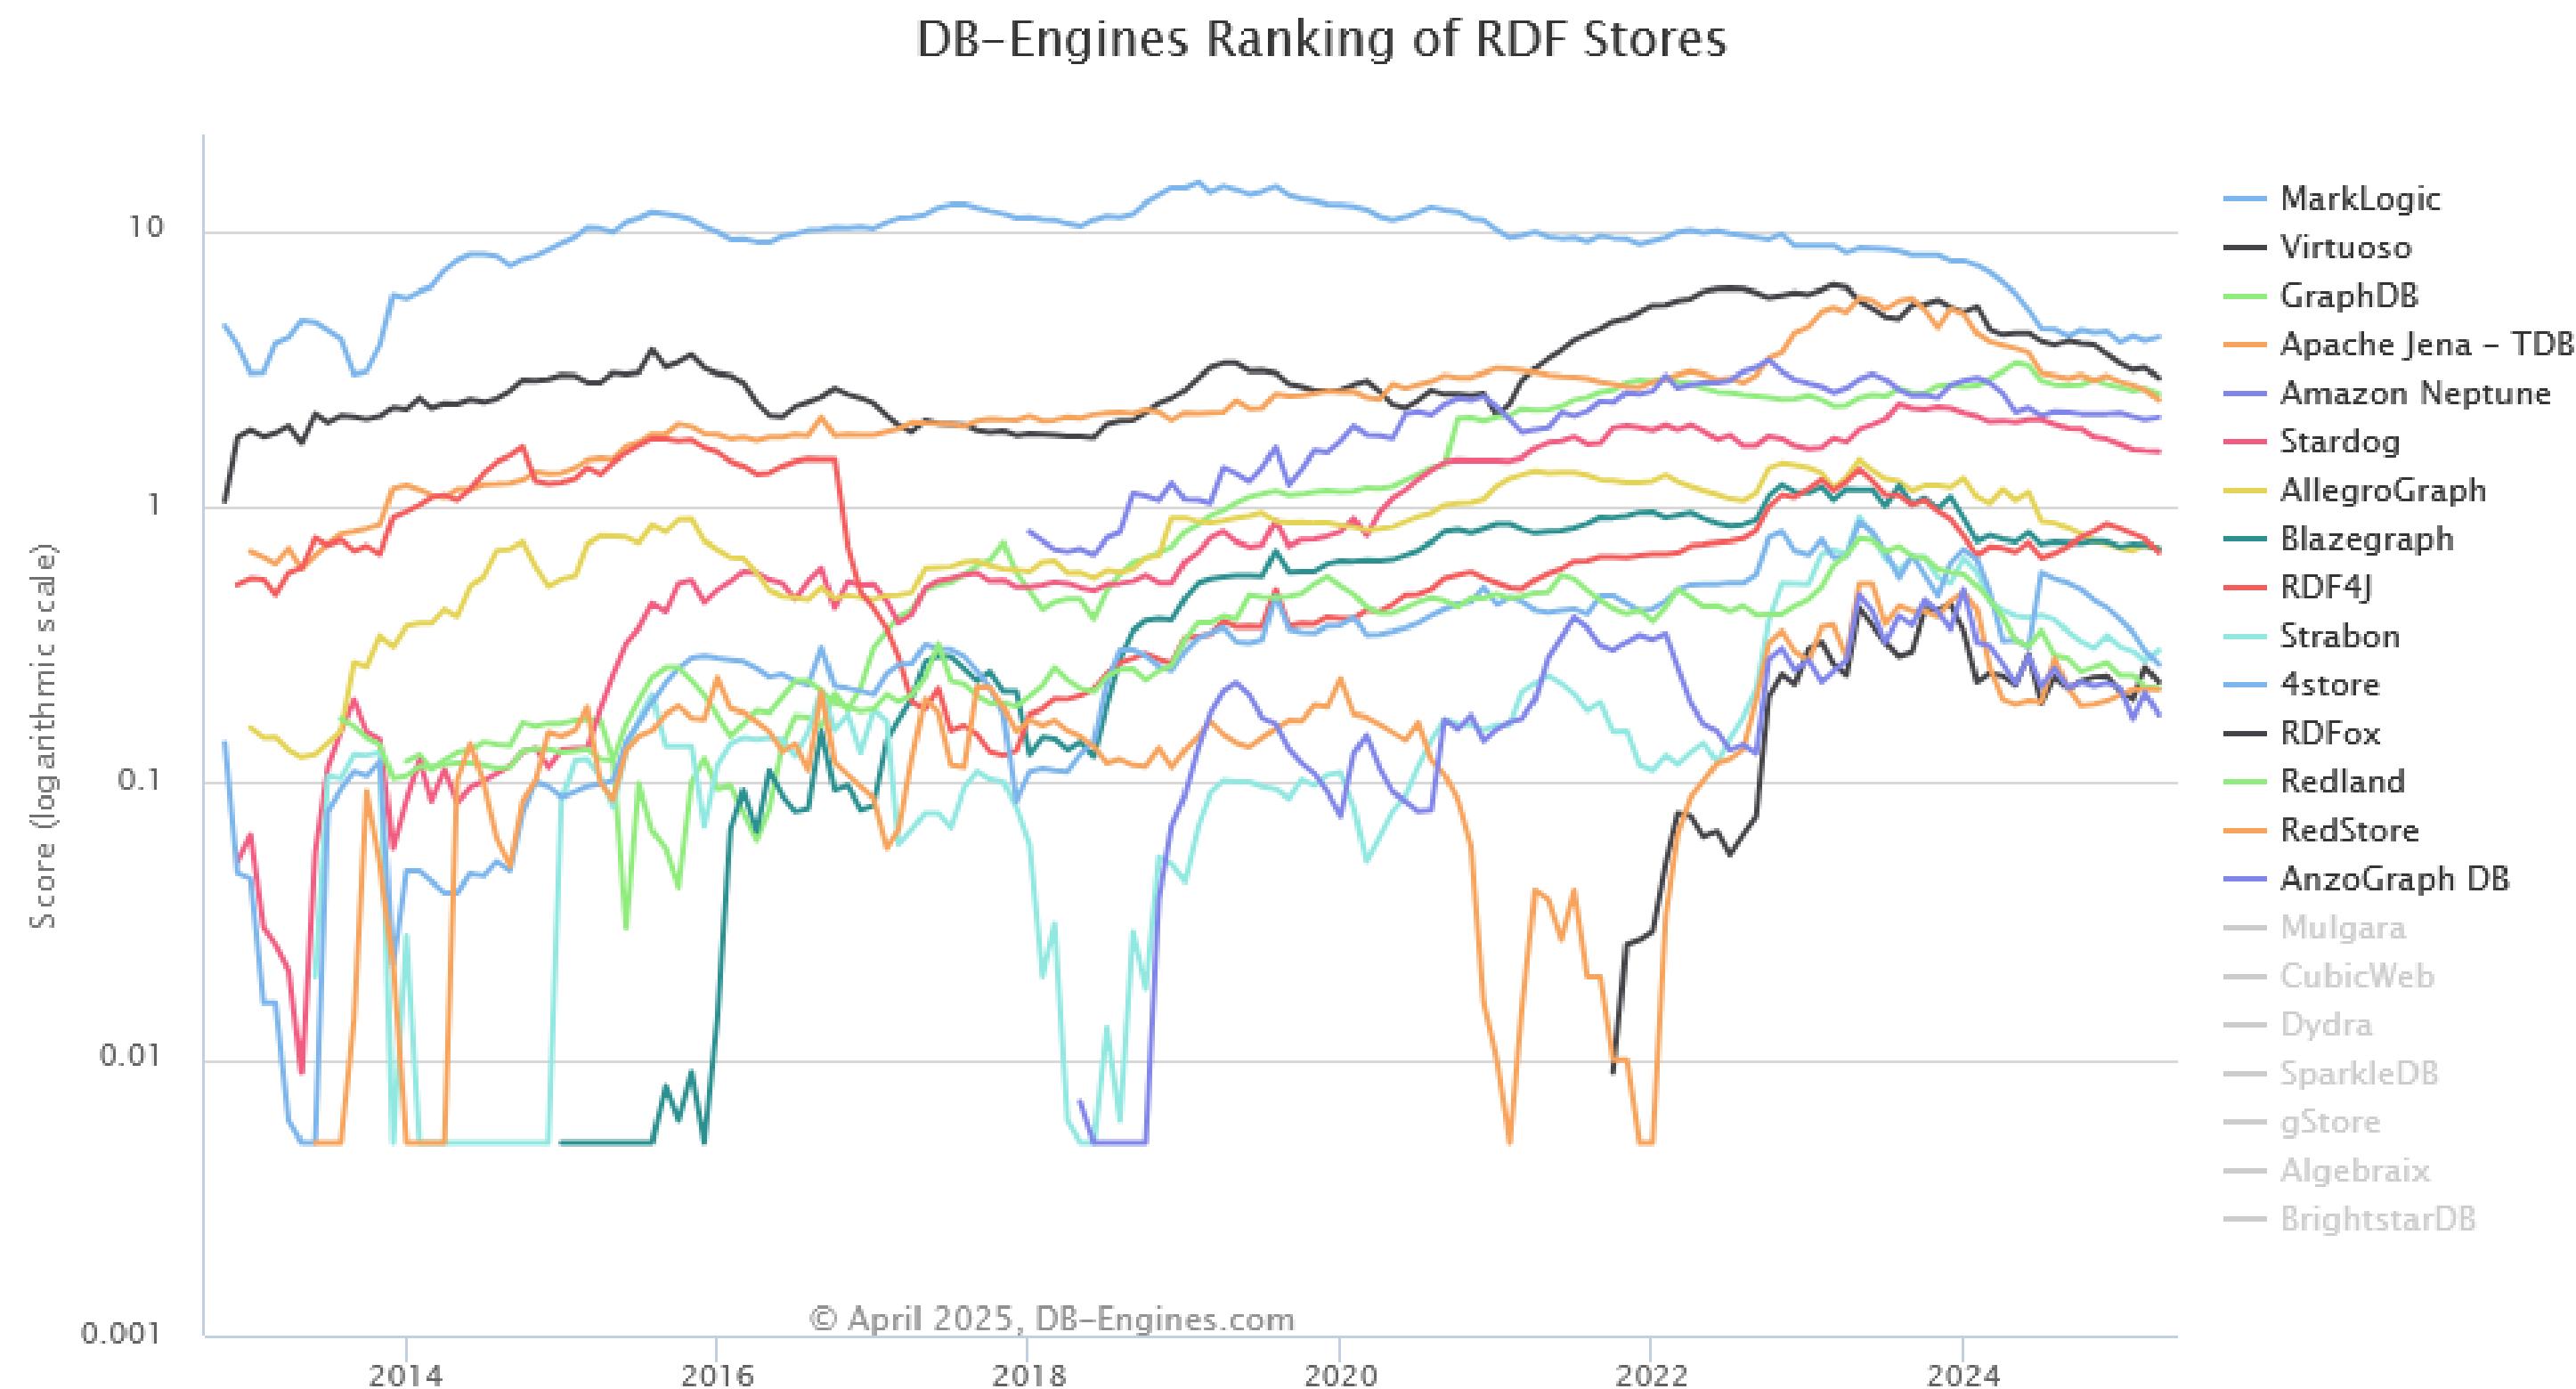

SPARQL queries consist of triple patterns, conjunctions, disjunctions, and optional elements. It can be used to retrieve information from **triplesstores** (a type of **graph database**) and to populate them.

Syntax description and examples by W3C:  
<https://www.w3.org/TR/rdf-sparql-query/>

# RDF stores

There are many software solutions for triple (RDF) stores and graph databases [rated by DB-Engines](#)

# SPARQL Endpoints

Many LOD datasets and repositories have a **SPARQL endpoint**, for example  
<https://query.wikidata.org/>

The screenshot shows the Wikidata Query Service interface. At the top, there is a navigation bar with icons for Wikidata (four vertical bars), Wikidata Query Service (blue text), Examples, Help, More tools, and Query Builder. On the left, there is a sidebar with five icons: a blue circle with a white '1', a blue double-headed arrow, a blue square with a diagonal line, a blue diamond, and a blue star. The main area contains a numbered SPARQL query:

```
1 #Cats
2 SELECT ?item ?itemLabel
3 WHERE
4 {
5   ?item wdt:P31 wd:Q146. # Must be a cat
6   SERVICE wikibase:label { bd:serviceParam wikibase:language "[AUTO_LANGUAGE],gle,en". } # I
7 }
```

# Wikidata

# Query builder

Build queries to Wikidata without SPARQL: <https://query.wikidata.org/querybuilder/>

The screenshot shows the Wikidata Query Builder interface. On the left, there's a search bar with the placeholder "Find all items...". Below it is a "Property" dropdown set to "instance of" with a "matching" dropdown next to it. A "With" button is highlighted in blue. On the right, a sidebar lists several entities: "Catalan" (Western Romance language), "Wikimedia category" (use with 'instance of' (P31) for Wikimedia category), "computed tomography" (medical imaging procedure using X-rays to produce cross-sectional images), "Catha edulis" (species of plant, commonly used by humans for its psychoactive effects), and "house cat" (domesticated feline). The "house cat" entry is currently selected, highlighted with a blue border. At the bottom, there's a checkbox for "Include related values in the search (recommended)" which is checked, and a "References" dropdown set to "with and without references". A "Add condition" button is at the bottom left.

WIKIDATA QUERY BUILDER

**About this tool**

The Wikidata Query Builder provides a visual interface for building a simple Wikidata query. It is ideal for users with little or no experience in [SPARQL](#), the powerful query language. The Query Builder doesn't offer SPARQL's full functionality, but you can always open your query in the Query Service, where you can view, edit or expand it via the link above the results. [Feedback is welcome here.](#)

# Five Star LOD Framework

Make available on the Web (whatever format) with an open license, to be Open Data

Make available as machine-readable structured data (e.g. Excel instead of image scan of a table)

Use non-proprietary format (e.g. CSV instead of Excel)

Use open standards from W3C (RDF and SPARQL) to identify things, so that people can point at your stuff

Link your data to other people's data to provide context
